Add rank in search result as data attribute

I am developing full text search plugin for Redmine. I want to add rank (score) to search result to check search result rank(score) easily. It is very hard to read debug log in real time.

Currently I need overwrite app/views/search/index.html.erb and app/views/search/index.api.rsb completely to add rank to search result. But I don't want to keep maintaining views in my plugin because it is very annoying to keep following upstream changes.

This tiny patch provides functionality to display rank(score) in search result. I don't add CSS to display data-rank attribute in search result html by default.

We can display data-rank value in search result using following CSS:

```css
#search-results dt a::after {
    content: " " attr(data-rank) ";";
    color: gray;
    font-size: x-small;
};
```
