

Redmine - Defect #2575

PHP Syntax Highlighting Not Working

2009-01-24 15:37 - Rakesh Pathak

Status:	Closed	Start date:	2009-01-24
Priority:	Normal	Due date:	
Assignee:		% Done:	0%
Category:	Documentation	Estimated time:	0.00 hour
Target version:		Affected version:	
Resolution:	Fixed		
Description echo "Hello World"; When the above code is used highlighting does not work correctly. It seems to default to using plaintext instead of the php.rb. There are no errors in the Log files. Any ideas what the issue could be, or how I could gather more debug information?

- File code.rtf added

Sorry. The wiki has attempted to format this. I have attached the real code I am using.

#3 - 2009-02-05 17:08 - Guillaume Lecanu

I have the same problems under v0.7.4
Thanks

#4 - 2009-06-30 08:01 - Abhi Beckert

It seems to me there are two issues here.

One is that the syntax highlighter doesn't handle a standalone code tag. The line numbers don't mess up if I do:

```
<pre><code class="php">
...
</code>< /pre>
```

And the other issue is that php syntax highlighting only seems to work in the repository browser, not in the wiki. In our redmine installation, we are using javascript as a workaround for this, since the syntax is very similar.

[...]

Hmm, this seems to be a design-choice made by the Redmine developers. I'll explain...

- Code within code tags (without a class definition) **is** handled by Redmine/RedCloth. Here's an example:

```
<c0de>
```

```
<?php
echo "Hello World!";
?>
</c0de>
```

renders as:

```
<?php echo "Hello World!"; ?>
```

Thus within these tags the content is rendered with a different font-family (monospace) and newlines are ignored. No line-numbering is added nor any highlighting is done.

- To enable highlighting (and to enable line-numbering) the code-tags should be used **with** a class-definition (which should be the name of a language which is supported by Redmine through the CodeRay-library) **and** they should be surrounded by pre-tags.

Example:

```
<Pre><c0de class="ruby">
# The Greeter class
class Greeter
  def initialize(name)
    @name = name.capitalize
  end

  def salute
    puts "Hello #{@name}!"
  end
end
end</c0de></Pre>
```

renders as:

```
# The Greeter class
class Greeter
  def initialize(name)
    @name = name.capitalize
  end

  def salute
    puts "Hello #{@name}!"
  end
end
end
```

Thus, within code-tags with a supported class-definition, which are surrounded by pre-tags, content is rendered with a different font-family (monospace), newlines are respected, line-numbering is added and highlighting is done.

- code-tags with a (supported) class-definition but without surrounding pre-tags **is not** supported and will mess-up the output heavily.

Example:

```
<c0de class="ruby">
# The Greeter class
class Greeter
  def initialize(name)
    @name = name.capitalize
  end

  def salute
    puts "Hello #{@name}!"
  end
end
end
</c0de>
```

will render as:

```
# The Greeter class class Greeter  def initialize(name)  @name = name.capitalize  end  def salute  puts "Hello #{@name}!"  end end
```

Thus, within code-tags with a supported class-definition, which are **not surrounded** by pre-tags, content is rendered with a different font-family (monospace), highlighting is done but newlines are not respected while line-numbering is added.

Here you have the "real" issue. Currently PHP syntax-highlighting does not work in Redmine at all except in the Repository browser. IIRC this was made possible due to a custom change by the Redmine Developers.

An example of the issue:

```
<Pre><c0de class="php">
function add_ending_slash($path){

    $slash_type = (strpos($path, '\\')==0) ? 'win' : 'unix';

    $last_char = substr($path, strlen($path)-1, 1);

    if ($last_char != '/' and $last_char != '\\') {
        // no slash:
        $path .= ($slash_type == 'win') ? '\\ ' : '/';
    }

    return $path;
}
</c0de></Pre>
```

will render without highlighting as:

```
function add_ending_slash($path){

    $slash_type = (strpos($path, '\\')==0) ? 'win' : 'unix';

    $last_char = substr($path, strlen($path)-1, 1);

    if ($last_char != '/' and $last_char != '\\') {
        // no slash:
        $path .= ($slash_type == 'win') ? '\\ ' : '/';
    }

    return $path;
}
```

The recent upgrade to CodeRay 0.9 RC2 solved this issue temporarily. The upgrade is reverted due to several other reasons (see issue [#3359](#) and it's relatives).

Most likely this issue will still be solved after completion of [#3359](#).

#6 - 2010-03-20 02:55 - Mischa The Evil

- Category changed from Wiki to Documentation
- Status changed from New to Closed
- Assignee deleted (Jean-Philippe Lang)
- Resolution set to Fixed

The recent upgrade to CodeRay 0.9 RC2 solved this issue temporarily. The upgrade is reverted due to several other reasons (see issue [#3359](#) and it's relatives).

Most likely this issue will still be solved after completion of [#3359](#).

The solution for [#3359](#) indeed solved the initial defect, thus I close this issue now.

NB: set the category to remind myself to rewrite the info for the [Redmine Guide](#).
