Previously, we would always jump to the issue if a user searches for a number which exists as an issue ID, regardless where the user searches. That made it impossible to search for e.g. prefixes of phone numbers in wiki pages.

With the attached patch, we are only jumping to the matching issue if we are searching for issues. This results in a behavior change for the quick search box in the wiki and other areas. Previously, we would also jump to an issue there. Now, we just search in the wiki for the number.

The quick search bar in issues as well as the global search for all objects is unaffected by this change.
