<b>Target version:</b>	
<b>Resolution:</b>	
<b>Description</b>	
<p>I do get some questions over and over from a few (very agile and reflective) customers. They go something like this:</p> <ol style="list-style-type: none"><li>1. How many (and what) issues passed "Queue to Backoffice" workflow-step (for a specific category or some other filter)?</li><li>2. What issues was tested by [insert tester] (show really as the member who change status from "Queue for test" to some of the new statuses indicating test passed or failed).</li><li>3. Who is our "best" tester (as defined in 2 above)</li><li>4. How many (and what) issues are at or have passed workflow-step "Approved by customer". First part of question is easy, the second is not.</li></ol> <p>I would assume most people solve this with (redundant) extra custom fields tracking the above information (like tester or a checkbox for approved by customer). Well, i do that too, but it's not all that good. I cannot handle retest and worst case i does contain the wrong info (i did the test and updated the issue but forgot to set the field).</p> <p>I know the tables and i do take some of this info via SQL (some joins) but would love to get it via GUI (and in summary).</p> <p>Is this a need for the rest of you as well?</p> <p>/T</p>

| *Is this a need for the rest of you as well?*

I don't have a need for it because my workflow is really open (anyone can change an issue to any status) but it might be useful to others.

+1. It would be good to have essentially having filtering and sorting based on journal data!
