Description

Hi,

Is it possible to factorize author name if there a user have multiple.
We have this problem when committing:

Author:

user1@laptop
user1@desktop
user1@office
user2@laptop
user2@desktop
...

And we like to set multiple alias (author name) for a Redmine user name.
Then when we looking at the statistics we have the real stats for the Redmine user.

Thanks a lot.

- Category changed from Accounts / authentication to SCM

- Status changed from New to Closed

- Assignee set to Jean-Baptiste Barth

- Resolution set to Wont fix

This could be easily achieved with the committers<->users mapping introduced a while ago, which should be honnored in statistics as soon as [#13487](#13487) lands (probably with Redmine 2.6.0). I know it's a bit manual but nothing forbid a scrpiting layer above.

Anyway, this problem seems too specific to be integrated as is in the core, so I close this issue, but you can re-open it if you strongly disagree and I'll be happy to discuss that with you.

EDIT: and of course sorry for replying that late to this issue... Redmine is a big project and few people actually do the needed triage work.
