On page https://github.com/redmine/redmine/blob/master/doc/INSTALL we can read what Redmine tested with MySQL 5.7 and should work fine with this version.

But on page http://www.redmine.org/projects/redmine/wiki/RedmineInstall we can read what Redmine is not compatible with MySQL 5.7.

Does Redmine compatible with MySQL 5.7 or not? On which page written truth?

If Redmine is not compatible with MySQL 5.7 - how it is possible to use Redmine with Ubuntu 16.04? Ubuntu 16.04 was packaged with MySQL 5.7 and have no way to use older MySQL version 5.0 - 5.5.

Can you please make Redmine fully compatible with MySQL 5.7?

Duplicates Redmine - Feature # 17460: MySQL 5.7 support

Redmine works well with MySQL 5.7. I'm running multiple instances on Ubuntu 16.04 and never ran into a problem.

In page http://www.redmine.org/projects/redmine/wiki/RedmineInstall you can read what Supported database back-ends are only MySQL 5.0 - 5.5 and what MySQL 5.6 or higher and MariaDB have known issues (#19344, #19395, #17460).

Until these issues are not resolved - MySQL 5.7 is not compatible with Redmine 3.4 and MySQL 5.7 is not supported.

- Duplicates Feature #17460: MySQL 5.7 support added
I'm closing this in favour of #17460.
