

Redmine - Feature #2925

Url to fetch changesets for a repository

2009-03-07 01:56 - Eric Davis

Status:	Closed	Start date:	2009-03-07
Priority:	Normal	Due date:

Category:	SCM	Estimated time:	0.00 hour
Target version:	0.9.0		
Resolution:	Fixed		
Description I'd like to add a url hook to Redmine's repositories so a repository can have it's fetch changesets called from a basic HTTP GET/POST. This could be linked up with post commit hooks or a web hook service (e.g. GitHub) to allow a repository to stay up to date without using auto fetch commits or a scheduled rake task.

Adds an action to SysController to fetch changesets of one or all projects (#2925).

Exemples:

- `/sys/fetch_changesets` (=> fetches changesets for all active projects)
- `/sys/fetch_changesets?id=foo` (=> fetches changesets for project foo only)

History

This might need part of the REST API implemented first, specifically authentication.

+1

Re REST API: I think the controllers need to be refactored first...

#3 - 2009-03-07 15:05 - Jean-Philippe Lang

I think we could easily add this entry point to SysController that already provides some repository related methods (used by reposman).

I think once REST is complete, we should remove SysController completely. Nice side effect is that reposman would be a good example of using the REST API.

- `SysController#projects` would become `ProjectsController#index`, `:format => :xml` (list of projects in xml)
- `SysController#create_project_repository` would become `RepositoriesController#create`, `:format => :xml` (create a new repository from xml)

I don't think we should just remove SysController though, it should be depreciated in order to give developers enough time to port to the REST API. I'm saying this because it's taken me over two weeks to recover from the Rails 2.2.x i18n and Enumeration API changes and I don't want to cause that pain on any other developer without giving notice.

But this would require a Redmine admin account to run reposman.
I don't think it's the best solution.

I believe that if you ``curl http://www.your-redmine.com/projects/your-project/repository | /dev/null`` in your post-commit hook it will cause Redmine to "look" at the repository, specifically fetch the changesets. If you have a private project this would become crazy-complicated, however, this seems to work for me (although I use a local Git repo on the server hard disk).

I'm not suggesting this isn't a good feature, I'm just saying that until the feature is done that a good band-aid solution exists (or exists with my setup - YMMV).

#7 - 2009-11-28 17:44 - Jean-Philippe Lang

- *Status changed from New to Closed*
- *Target version set to 0.9.0*
- *Resolution set to Fixed*

Added in [r3107](#).

#8 - 2014-06-26 21:26 - Lukas Pirl

There is also [a plugin](#) to fetch commits for a specific repository only.
