

Redmine - Defect #30457

MailHandler.safe_receive does not output any error log

2019-01-17 18:03 - Go MAEDA

Status: Closed	Start date:
Priority: Normal	Due date:
Assignee: Go MAEDA	% Done: 0%
Category: Email receiving	Estimated time: 0.00 hour
Target version: 3.4.11	Affected version:
Resolution: Fixed	
Description	
<p>MailHandler.safe_receive has a rescue clause that seems to be intended to catch all exceptions and log it.</p> <pre>def self.safe_receive(*args) receive(*args) rescue Exception => e logger.error "MailHandler: an unexpected error occurred when receiving email: #{e.message}" if logger return false end</pre>	
<p>However, the expression "logger.error" does not log any events because the variable logger is undefined. Although there is a method definition for "logger" at source:tags/4.0.0/app/models/mail_handler.rb#L77, you cannot call the method from MailHandler.safe_receive because MailHandler.safe_receive is a class method and MailHandler#logger is an instance method.</p> <p>As a result, the expression logger.error in MailHandler#safe_receive never logs errors because the expression itself causes NameError. To avoid this, logger should be replaced with Rails.logger. The attached patch fixes this issue.</p>
