**Description**

The Ajax repository browser is nice and easy to use :) I think all agree.

I think, it would be even easier, adding following feature:
- on folder expand, lookup if there is only one folder -- if so, repeat the expand until more than one element is found or end of structure reached.

This is useful when expanding java packages, like: org.company.application.module.functionality e tc usualy containing only one folder. Having auto-expand in place -- would save "clicks" and time.

Thanks for a great tool!
