Description

Currently the query filter set can only search the last value of the fields of issues.
And the filter "Updated" can only search updated during a period, but can't search what is updated, and what is/was the value of it.

It would be better to expand the query of the "Updated" to search from the journal.
such as:
updated: add more query criteria to filter which property/field is updated, and the old/new value of that property/field
or:
query: field value was xxx at xxx time, operator can be was during, value: field value + datetime1 + datetime2
or:
query: updated + fieldvalue at that time
