**Description**

Is it possible to place downloadable files on a remote host.
Host A run redmine, and Host B with more bandwidth and disk space holds files.

The files could be always store on A and sync with B.

With this option, the Url of downloadable files would be modified

**History**

+1. Good to have feature.

I wondering since there is a plugin like Redrop , Dropbox Attachment Storage and Redmine S3 - that means, the above stated should be easily solvable by a plugin, yet there is no direct plugin which allows me put on any standard HTTP or FTP/SFTP server. :(
