<b>Target version:</b>	
<b>Resolution:</b>	
<b>Description</b>	
<p>I created a custom field in the activities that should contain different code for each activity. Also the codes could be different in the different projects. This is supported from Redmine and works fine.</p> <p>activities.png</p> <p>I tried to access this data from outside (using Python-Redmin library) and it seems to be impossible. The developers of the library said that this is not supported from the Redmine API and they cannot solve this problem. I will appreciate extension of the Redmine API that will allow access to custom fields in the activities.</p>
