Description As version 0.50 redmine doesn't support concurrency control on wiki. I've been searching around, and found this info on the wikipedia: http://en.wikipedia.org/wiki/Optimistic_concurrency_control wich says that rails already provide concurrency control, and in fact there are Optimist and Pessimist concurrency control in rails. I'm not sure about the time needed, and difficulty to add support, but it would benefit a lot redmine, because it will provide team work on project documentation. Thanks for all!			

History

You're right, rails supports optimistic locking. It's already used in Redmine for issues.
Now, it's done for wiki edits (committed in rev 545).

Regards
