Target version:			
Resolution:			
Description			
When I select the Users tab in the administration area it would be nice to see the users role on that page. Maybe even the ability to categorize or list in order of role, and ability to quickly edit from this one page.			

History

As i understand the current model, the roles are project specific. So if a user is Manager and Developer on Project 1 and Manager on Project 2 the column would say Manager Developer Manager.

With many projects where the user is involved, the column would grow endlessly.

Well with regards to how I use Redmine, I'm the only admin, and I only have clients and developers on projects.

The User's page listing doesn't allow (and cann't allow) the all roles displayed in each project. That would be very clumsy. But if you click on the user, it will show's all his/her roles.
