Description

Hi,

I fell in love with cucumber recently. I'd like to add a page in the wiki with all the features in the repo.
The only way I've found is to put a link like

```
source:features/
```

It would be very handy to list all files in /features with ".feature" extension, and generate automatically a link. That would help a lot of projects showing their features in an automated way.

This feature would also support branches, in order to distinct stable features from bleeding edge ones.

Thanks.
Philippe

- Category set to Wiki

This could probably be done by defining a wiki macro from a plugin. Do you have an idea of how it should look when it's rendered?

I think we can start with something simple like :

- A UL list with .features as li. Be careful, features files can be organized in subfolders, then we should create sub-UL also)
- Each li is a link to the .feature file, which is a plain text file (some examples here : http://is.gd/1VEnc)
- I've found this : http://wiki.github.com/jgoodsen/rcumber if it can help

Thanks !
