Description			
<p>I have a limitation within my LDAP server to avoid user for login more than one time on a Windows computer. So, when they are connected to their Windows machine, they can't authenticate on Redmine using the LDAP auth source.</p> <p>Is there a solution to authenticate a user with his login and his password without a ldap_con.bind ? Is it possible to do a search and compare login/password to the LDAP database ?</p> <p>Tx, Pat</p>

Why not just run NTLM/SSPI authentication? Thomas Löber explains it greatly in <http://www.redmine.org/boards/2/topics/127>.

Kind regards

i do konw nothing about NTLM/SSPI authentication. My Redmine server is running on a Linux box, not a Windows one.

Sorry, I assumed from your description that you wanted windows users to automatically login into Redmine, with same username/password as they use to login to windows. This is typically done with ntlm/sspi authentication (which would be similar to doing redmine ldap against Windows AD).

Please accept my apologies for misunderstanding you.

Kind regards

Patrice,

I'm doing this using the patch from Adi ([#1913](#)). There was another patch by Will ([#3253](#)) that also added some other features to the LDAP authentication.
