**Description**

I'm looking for a way for a multidimensional array to be able to capture the following scheme:

Custom field: model (wood screw, diameter 4mm)  
Definition 1: model type (length)  
Value 1: value (order quantity)

Of course, it would be even better if the definitions were variable and you could create even more dimensions:

Custom Field: Model (Wood Screw)  
Definition 1: model type 1(length)  
Definition 2: Model type 2 (diameter)  
Value 1: value (order quantity)
