Description Hi, Since i use Project Hierarchy, I never need top project SCM Repository. Main Project (No SCM) <div>Sub Project 1 (SCM Repository)</div> <div>Sub Project 2 (SCM Repository)</div> So using Reposman.rb should create Repository even if SCM Module is enabled on project

So using Reposman.rb should create Repository even if SCM Module is enabled on project

I don't understand your problem.

I've just tested this in redmine :

Create a main project with SCM module disable
Create a sub project 1 with SCM module enabled
Create a sub project 2 with SCM module disable

And reposman say :

```
% ./extra/svn/reposman.rb -s /var/git -r localhost:3000 -o www-data --test
running in test mode
create repository /var/git/subproject1
```

So, if SCM module is enabled in a subproject reposman create a repository.

- Status changed from New to Resolved

My bad ... You right, no problem here.

You can close that issue.

Thanks..
