**Description**

Hi,

Actually Lot of objects in redmine had an id or a name (visible by users) but no reliable field between several redmine environnements (several database, several uses)

I work with several environnements with databases which are not synchronized (so ID are différents between them, and name can evolved et be different)

I need to synchronize parts of Redmine between environnements (always in the same way environnement A -> environnement B)

For me, it's not reliable to create my synchronization on an ID or a Name, i think we should have a technical name/identifier on the objects.

So what do you think of adding an identifier at least on those elements :

- custom fields
- trackers
- workflows
- ~~projects (already exists)~~
- roles

What do you think of this feature ?

Regards
