### History

## #1 - 2023-12-04 19:23 - Holger Just

- Status changed from New to Closed

#### - Resolution set to Wont fix

here is no explicit error handling (and specifically no error handling which just ignores errors) for any of the hooks. This is deliberately done in order to ensure that (1) errors are noticed and (2) so that the default error handling can meaningfully handle the exception, e.g. by causing a ROLLBACK of the current transaction, to ensure that the consistency of the stored data is ensured.

If we were to introduce a general begin / rescue block around each hook call which merely logs but ultimately ignores any errors, there would be considerable risk for data consistency issues. In the general case, just ignoring any exceptions is not a good idea.

Thus, if a plugin registers a handler for a hook, it is the plugin's responsibility to handle any exceptions which may be raised by its own code. If the plugin chooses to ignore all errors in its hook, it can add an empty begin/rescue block on its own.
