Description

If a string field has value which are wiki pages, it is very useful to improve relationship between wiki pages and issues.

If it is possible, I can use this fields the following purpose.

- Related Requirement
- Related Design
- Related Customer

This wiki string field must have some user interface features.

- link to wiki pages.
- If linked wiki page is not exist, show it some differently, red?.
- If this field has an option, which is "view the fragment of page", linked wiki pages are displayed with overflow style sheet property that has "none" value.
- If this field has an option, which is "multiple", several wiki pages can be used as value with comma.

It is possible?

I tried(reviewed) some AGILE plugins which have backlogs and so on. But I found Wiki is more useful.
Each issues are scattered but wiki pages are central and version controlled by Redmine.

If it is possible, the wiki pages can have a macro, which is named "{{related_issues(optional field names)}}".

Is it NICE?

Thanks.

We looked into this from possibly another point of view, could it be useful?

See #5250, where basically we change custom text rendering so that it goes through textile transformation every time...

Sorry, I may helpful for wiki link in a issue view.

But my suggestion is focused on relation between WIKI and ISSUES.
I guess the **WIKI central development processes**.

One requirement will be changed by several stakeholders and developers.
And its issues are scattered in a project. But if all issues on this requirement has relations to the requirement WIKI page, users can track the changes of the requirements and its solving status.

Thanks a lot.
