ya, Multi-level permissions to documents and files will be very useful.

+1
Looking for a feature like this as well.

#4 - 2011-01-27 19:33 - Ian Epperson

Similar to #4550

+1 ! This is a must-have feature for organizations that need to share documentation to different levels (managers-onlyreports, technical stuff, client-ready docs...)

#7 - 2012-05-21 10:51 - Simon Cadec

+1
Very important feature. Permissions to add, edit, delete and view documents...

#8 - 2012-05-31 14:42 - Richard Rauch

are there any news about this issue? nobody else would need such a feature.
In my project I would need a similar thing.
I grant access to my customers to specific projects (e.g. for bug tracking). in the document folder there are current Versions of user manuals, but also internal development things like protocol specifications, to which the customer should not have to access.
is it anyhow possible to create categories of documents with different access levels inside one project?
of course I could add a sub project without customer access, but this will explode the amount of projects at all...

any ideas?

#9 - 2012-05-31 17:58 - Richard Rauch

maybe for documents is is possible to implement a simple solution...

we have already document categories and we are already able to add custom fields to categories (settings in Administration)

my idea is now to create a category like "development internal" in which a custom boolean "internal" flag is checked.
in the code, which is generating the list of documents, we need to check this flag and compare to user group or permissions.

this would be a preliminary solution, it could be improved step by step...

I would write this code (maybe as plugin), but I would need assistance. I have now about 1 week experience with Redmine and Ruby on Rails. I would need assistance, where I will find corresponding code, how to access custom fields from source code and how to integrate to a plugin.
is there anybody, who will help me?
