Exclude "fields_for" from overridden methods in TabularFormBuilder

...since it's broken in some way in current implementation, and it's never called on the builder itself in Redmine core. It would be helpful to handle nested attributes in plugins.

To be clear, I'd like to be able to do something like this:

```ruby
f.fields_for :association, MyAssociatedModel.new do ... end
```
or

```ruby
f.fields_for :association, @main_object.my_associated_models do ... end
```

...where "f" is a standard TabularFormBuilder.

But it's broken in current implementation since method is overridden with a different signature than its parent:

```ruby
fields_for(field, options={})
```

VS

```ruby
fields_for(record_or_name_or_array, *args, &block)
```

Patch attached, no test broken on my platform with current trunk (r3704). I can give a more detailed example if needed.
