Description

It would be very interesting to be able to bulk edit some custom fields from the issue list as in the above screen.
issue_list.gif

For example, when you need to assign an importance to the issues, it is very boring and long to open and save each issue to assign the values.

Well this could be some idea, but completely replace the current bulk edit with this suggestion won't be a good deal.

Another idea could be, to add some edit icon on the issue list. This will replace all text fields in the current issue list with the corresponding form elements (input fields, text area or selects) which enables some kind of quick edit for many issues. After editing those filtered issues, the user could click on save and trigger the ticket updates this way.

What do you think about this suggestion?
