Description
Hi,
I'd like to see a feature to add "Affected version" to the issues, which will be a list, and draw values from the version information (just like target version). This way I will not have to maintain a list of released/future versions for 2 fields per project!

Oh, to be more precise. The field should not be required, but should be selectable by anyone who can report an issue.

Displays as: List (default no value selected)
Not required
Usable by all projects
Draws values from each separate projects "version information"
Displays on: new issue form, viewing issues (shows in a reported ticket, alongside all the other values)
Allowable to show on issue list, disabled by default though

I keep remembering more information about this...

I don't think it should be showwn for certain trackers, e.g. feature tracker. Perhaps selectable to use per tracker (but enabled by default on bug and patch tracker)??

This functionality is now possible out-of-the-box using custom field of type "version".

This issue should be closed now.

- Status changed from New to Closed

Indeed, a custom field should be used.
