Description

When reviewing a large list of issues, each time you update an issue you go back to the bottom of the list.

One approach is to lower the number of items per page, so that you come back to the page you were before, but it doesn't satisfies me at all because it breaks the global view you can have with a complete list in one page.

Here are two possibilities :

- updating only the lines in place through an ajax call ; there's a risk it's not filtered or sorted the good way after that, but it's less problematic I think.
- remember where the user was with a bit of javascript and scroll down to the same place (my preferred option for the moment)

Any though about that ?
