Description

i'd be great to have one or more rake tasks to query some stats from the database from the command-line.
this could be used to track projects and bugs in munin/nagios/cacti/...

some things i'm interested in are:

- list of all projects (names)
- number of bugs for each state (OPEN, CLOSED, ...) for all projects (default) and a specific project (argument) for each traker (or one specific from argument)

just implement whatever stats you'll imagine to be useful.
perhaps forum/wiki can generate some interesting stuff, too.

- Status changed from New to Closed

- Resolution set to Wont fix

I think a third-party plugin should implement this feature, as few Redmine admins would benefit from this feature.
