| Description | | | |
| Hi | | | |
| The documentation recommends that Redmine run behind a reverse proxy such as nginx for doing SSL and caching. | | | |
| Is it on purpose that the internal URL ("localhost" in my case) rather than the external URL from Administration --> Settings --> General --> Host_name is exposed in this configuration? | | | |
| Every time a user hits a page and is redirected to the login page, the back_url parameter in the query string contains the host "localhost". | | | |
| Attached is a patch to fix this, in case it is not intentional. | | | |
