

Redmine - Feature #6813

List all users/roles who will be notified by an issue create/update and allow selection

Description			
<p>There are lots of feature issues to do with trying to limit the amount of emails redmine send out and I think its fair to say the current default config is email heavy. Also not all the tools/settings are quite developed enough to allow everyone to configure emails the way they want - hence all the feature requests. I would suggest lots of people would like email notification to be a bit more granuala and transparent from the UI</p> <p>Related email issues #6390 #6229 #5862 (and there are no doubt more...)</p> <p>I suggest that the issue creation and update forms always list exactly which users and or roles will be notified by email so that its obvious who is getting an email.</p> <p>Then as a further refinement allow users to untick some recipients from this list of email recipients. (its already possible to add new people via watchers I believe). This would mean that users can put loads of info/updates to an issue without worrying about spamming everyone and I suggest the number of unnecessary emails sent by redmine would be dramatically reduced</p> <p>It would also make sense that this option can be disabled/enabled by admin/roles so the current email behaviour of notifications could be maintained if desired.</p> <p>I think this would dramatically reduce unnecessary emails sent (if used sensibly!), and reduce the need for most other feature requests dealing with controlling email notifications.</p>

Sorry - please assign category email notifications - or allow issue creators to!

it's a good idea.

I would agree that some improvements are needed with the notification system.

Here is a comment from a member of my team shortly after we deployed Redmine for wider testing.

"I thought I was drowning in email before, but Redmine notifies me about **everything**. How do I control what I get email notifications about?"

Our code review tool has four settings of notification:

- any activity
- activity by the author
- file level activity
- someone pokes me

Some controls along those lines for issues could be:

- any activity
- activity by the author
- only on "significant" change. e.g. status/tracker/project change or file attachment
- only when the updater selects notify all as part of the update process. e.g. have the submit button and a "submit and notify" button?

Thanks
