Description

It would be great to have the possibility to be able to query the subtask of an issue with an interface similar to the issue query interface.
When a issue is full of sub task, the list on the issue description page is not sufficient enough and if I want to see for example the estimated time for each subtask without any parasite data, I can't.

You can use the parent task filter in the issues list.

- With **parent task - is - ID** you can get direct child issues of the issue with the named id
- With **parent task - contains - ID** you can get child issues of any level (including children of children) of the issue with the named ID.
