**Description**

hello,

we are running a redmine installation the first time behind a hardware loadbalacer and when we activate "Authentication required" and someone is browsing to the starting page <https://domain.com/> -> then the user is redirected to [http://domain.com/login?back\\_url=http](http://domain.com/login?back_url=http) ....

we cannot set

```
RequestHeader set X_FORWARDED_PROTO 'https'
```

at the loadbalancer. when setting this on the backend servers this doesnt change anything. wouldnt it be useful if redmine would read the virtual host setting ServerName https://domain.com ? this works for any other application (like shibboleth stuff) but not for redmine.

any ideas how to solve this?
