

Redmine - Feature #7980

New user management permissions: add own member, change role own member, delete own member

2011-03-24 03:17 - Terence Mill

Status:	New	Start date:	2011-03-24

Target version:			
Resolution:			
Description If admin gives groups their roles on project, project manager shouldn't be able to change admin made settings. But he could add further other users/group and give them rights - of course not ones they already set by admin. So project manager then should be only able to change/remove the users he added itself, but never that ones set by an admin. I think for many companies this would be needful, where are own an external team members. Company team mates can be set by admin, eg. automatically via ldap groups and additionally project manager can handle fluent external members by its own. So project manager can't "accidently remove its own team members which are managed by ldap grouping by field service.

Do you mean you want to give the project leaders the mean to create groups and add any members in it ?

This can be very interesting, because actual groups managed by Administrators are not really usable :
Administrators lose time getting a project vision (knowing what are the projects and their members, which one have changed etc.), and in big companies, it will lead to a big overhead on their job.

Project leader have the knowledge of each need and movement, and have the time in each of their projects to do the according changes in the groups memberships.

The Administrative groups are a good thing linked to LDAP, for a corporate vision (Business Units memberships).
But on the project basis they should be managed by the project leaders, to include company and customer members.

I would agree on this. This is something which our admins suffer from.
