Resolution:			
Description (using 1.0.4, soon to be 1.2.0) I would like to be able to watch a target version like I can an issue. An important part of that is that I would to be able to easily see, and have timely notification of additions to or removals from a target version. This would help prevent issues from being sneaked into a target version, and to help more people be aware of issues that get dropped from a target version. I guess the all signing all dancing version of this request is an ability to configure what is watched for. But I would be very happy with the ability to watch all activity associated with specified target versions. Thanks
