<b>Description</b>			
Hello,			
<p>In my job we use Redmine and recently we had the need for authenticating the access to a test domain, based on which users have access to the related project. I created a small patch to the Redmine.pm module, that adds a new optional apache directive (RedmineDbProject), so you can link a VirtualHost to a specific project and ask for credentials on user access. That way, only the users included in that project can see that VirtualHost contents.</p>			
<p>I felt somebody else might have the same needs. The directive is optional and the behaviour is transparent if it's not included in the conf file, therefore I think it can make it to the core.</p>			
<p>The revision is 5506 (last change on Redmine.pm on 5232), and it's the trunk version.</p>			
<p>Best Regards,</p>			
<p>Diego Suárez García.</p>
