Description

Hi there,

I would like to know if it is possible de fetch issues from two different imap account and create new issues within 2 différent Projects.

For example, i would have a first email account support@mydomain.com. Each new issue send to this email will be created on a Support project. I would have a second email account myapp@mydomain.com. Each new issue send to this email will be created on a MyApp project.

I am using redmine:email:receive_imap within a bash script file run by a crontab task.

I think i have to do 2 different bash files, one for the support@mydomain.com account and a second for the myapp@mydomain.com account.

Am i right ?

Tx

- Resolution set to Invalid

See RedmineReceivingEmails, host is an argument of the receive_imap rake task.

And please ask questions in forums, this tracker is for bugs and features only.
