

Redmine - Defect #844

Custom fields helper uses local- instead of instance custom_value variable

2008-03-12 23:14 - Christian Bryn

Status:	Closed	Start date:	2008-03-12
Priority:	Low	Due date:

Target version:		Affected version:	
Resolution:	Fixed		
<div><div>Description</div><div>Hi!</div><div>I realize this bug is a cause of my hacking attempt and thus not visible on a standard install, but here goes:</div><div>I was to rearrange fields, including 6 custom fields on the issue add/edit form (app/views/issues/_form.rhtml). I assumed I could refer to the specific fields using i.e.</div><div><p><% custom_field_tag_with_label @custom_values[3] %></p></div><div>...this works when adding new issues, but when editing an issue the custom fields loose their data/selected value. Saving the issue will save empty values (or scream about empty required fields ;-)</div><div>Some debugging revealed what seems to be the problem: The custom_fields_tag function passes a local variable custom_value to the HTML-field functions (defined in the form_helper.rb), i.e. text_field, which takes instance variables. From api.rubyonrails.com:</div><div>text_field(:post, :title, :size => 20) # => <input type="text" id="post_title" name="post[title]" size="20" value="#{@post.title}" /></div><div>...which is why I reckon it works when looping over the @custom_values, @custom_value is correct when the input field is being assigned its value.</div><div>I have attached a quick fix for custom_fields_helper.rb to make this work. I found the bug in 0.6.3, but the behavior is the same in subversion.</div><div>Regards, Christian Bryn</div></div>			

History

#1 - 2008-06-27 22:37 - Jean-Philippe Lang

- Status changed from New to Closed
- Resolution set to Fixed

This problem no longer applies to [r1592](#).
CustomFieldsHelper#custom_field_tag uses *_tag (eg. text_field_tag) helpers instead. These helpers do not rely on instance variables.

#2 - 2008-07-01 12:03 - Christian Bryn
