Redmine - Feature #8479

Global default query

Description

It would be helpful to have some way to define a custom default query. Ideas:

a) Design a custom query in Administration > Settings > Issue Tracking
b) Select a saved public query to use as the default query (Admin > Settings > Issue)

In my case, what I'm trying to do is show the users their New and In Progress issues sorted by a custom field, which I use for ordering, with only specific priorities.

Similar to, but (after reading the comments) not quite the same as #7360

The feature will be available in Redmine 5.0.0 (#7360).

You will be able to configure the app level default query in "Default Query" in "Administration" > "Settings" > "Issue Tracking".
