Redmine - Feature #8624

revisions should always be automatically fetched

2011-06-16 01:25 - Dave Abrahams

Description
I consider it a usability bug that a project's changes/ and revisions/ URLs behave differently per #8610. People will notice the revisions/ URL in their browsers' address bars and assume—as I did—that it's a legitimate and reliable way to get to any revision in the repository. It should "just work."

Oh, this is even worse than I thought it was. My original understanding, from what was said in #8610, was that if I was getting a 404 by going to https:// *my-redmine-site* /projects/xxx/repository/ **revisions** / *some-SHA1* , that I could instead visit https:// *my-redmine-site* /projects/xxx/repository/ **changes** / *some-SHA1* . But apparently I was wrong. I need to generate links into my repository browser from my automated test results page. Unless I can link to something that will cause changes to be fetched automatically, my users will get 404s and the system won't work for them. What should I do?

Set up some automatic fetch mechanism ?
