Resolution:			**Affected version:**	

Description

Ruby Version: 1.8.7 (2010-01-10 patchlevel 249)
Rails Version: 2.3.11
MySQL Version: 5.1.41-3ubuntu12.10
Redmine Version: 1.2.1.stable

The mailhandler does not "gracefully" fail when a custom field is detect with an incorrect value in an email. When I say gracefully I mean that if the custom field is not required then it should ignore the field detected, not attempt to set it, and continue processing. As it stands now it errors out with a 422 error code.
