Description

It would be nice to have a list of all "incoming" links for every single wiki page.
When editing content on a specific page, you see, which other pages provide links and possibly need to be updated as well.

Have you tried assigning parent/child relationships? This will allow the links to be automatically refreshed. The child pages show up listed under the parent in the Sort By Index as well. It's helped on our wiki pages, but the downside is that you can only assign one parent, so if you have a lot of cross-referencing, you still don't see every connection.

You can assign by going to the "child" page, going to the Rename screen, and then selecting the Parent you want. It will give you the option to automatically update links. Better instructions on that are available under the Creating sub-pages section here:
