Description			
<p>I'm syncing all groups and users with our Active Directory (LDAP), using the <code>redmine_ldap_sync</code>-plugin. https://github.com/thorin/redmine_ldap_sync</p> <p>Today I have to set all users manually as <i>Administrator</i>.</p> <p>If there is an option to define an group as <i>Administrator</i>, I could add/ remove users within our Active Directory Group and they automaticly get the permission to administrate redmine.</p> <p>Since administration user changes will not happen very often, I set priority to <i>low</i>.</p>

U can define a role giving it all rights, then create a group and give the group the role for all projects. I am not exactly sure which features are missing to "system admin" but for us managing projects is admin enough.

Maybe the plugin option "Attributes to be synced" can be enhanced to sync "admin" switch for redmine user object too. You then would need an ldap attribute for ur ldap user class with same name as redmine admin attribute.
