Redmine - Feature #9740

De-conflict with multiple LDAP and local users

Description

We are setting up a RedMine server for collaboration between two different universities in Iceland, each with their own ActiveDirectory server. There are also collaborators who are not in either system. Is there a good scalable way to deal with the possible name conflicts? I have seen mention of
username@domain or DOMAIN/username
but the various web links say that won't work. Are the suggested modules/solutions?

Previously we have used username_ext for people not on our LDAP servers, but this is a hack.

- Status changed from New to Resolved

Moved this to the forums. If no response, I'll move it back here.
