Resolution:	Invalid			

Description

Maybe I'm missing something but when setting permissions I can't set different setting for the same role in another project:
for example , I want that in project "A" a developer can set issues public or private but in project "B" he can't.
Do I have to create a new role for this scenario?

It will be very helpful if it could be implemented.

- Status changed from New to Closed

- Resolution set to Invalid

Yes, roles are designed to handle different permissions on projects for the same user.

I guess you are confusing roles with groups.
