The subject says it all. The partial _revision_graph.html.erb (in app/views/repository) sets window.onload directly. As a result of setting window.onload directly, it toasts other onload events on the repository page (currently messing with a plugin that I have).

Instead of:

```javascript
window.onload = function() { stuff; }
```

should use the prototype syntax used elsewhere in Redmine:

```javascript
Event.observe(window,"load",function(){ stuff; });
```

I believe that this started showing up when I pulled down the 1.2.2 updates (not entire sure of timeline)
